can be :code1, :code2 etc. How can I build a query to get all the models that have only the codes :code1, :code2, etc, but not :code3? A: Try something like this where("codes NOT IN

(?)", ['code1', 'code2', 'code3']). Q: How to fix a certain problem with "vimeo like" player in videos.google.com I was just looking at a video at vimeo.com and saw that it looked and played

differently than the videos that I find through Google. In Google it is always a black top and bottom bar with the video in the middle. On vimeo, it is black with no bars and the video is centered

in the screen. What do I need to change to get the same video in videos.google.com? A: The videos are downloaded by the video service. Vimeo does not stream the videos directly

in your browser. Besides the position you mention, there are also other differences, like: the media files are different, e.g. sometimes Flash is used, sometimes HTML5. the quality is different,

resources. I do not want to have the application in a bad state. How can I delete the topic and all the streams? Is it possible to start a new Kafka Streams application with the same producer/consumer for

that topic? Is it possible to start a new application (with the same configuration), so that the new application has it's own streams? A: In Kafka, the topic can be deleted, but not all the

streams. Kafka Streams stores the information about the streams per topic. To update existing streams, you can simply delete the topic and recreate the application again with the new topic.

Kafka Streams also supports session mode for the whole application to avoid writing the data to the topic (and storing it there forever). This is the default behavior. If you don't want this, you have

to remove the application's configuration. You can do that using the following command: ./kafka-streams-app.sh -c config-application-1.properties -z U.S. withdraws from UN
