For beginners, Photoshop Lightroom, which provides the same basic operations for organizing and manipulating images, is probably a better first choice. Photos are composed of pixels. An image can be made up of a single pixel, or thousands of them. Photoshop uses pixels, usually 8-bit or 24-bit, to create its effects. This chapter focuses on the areas in which you can see the difference between the two systems and how Photoshop processes your image in each system. Choosing Between Pixel-Based and Metadata-Based Systems Many photographers who shoot film or digitally are familiar with a pixel-based system for editing. The pixels are the square units of an image that Adobe Photoshop uses to describe a photograph. When you see the word pixel, think of the small dots of color on the pages of books and magazines. While Adobe PhotoShop may use pixels and compare them to other images, it doesn't rely exclusively on them to create or edit images. In a metadata-based system, your images aren't represented by dots of color—they're represented by data that tells Photoshop how to create an image. The data is in a file that contains lots of numbers and letters that describe how the image looks. The file for an image is usually called an EXIF (Exchangeable Image File Format) file and is usually stored in the root directory of a digital camera. This EXIF file contains information including the name of the camera that created the picture, the date it was taken, the exposure time, any corrections, and the aperture and shutter speed used to capture the image. When you have your pictures in a folder on your computer, you can choose to view the EXIF information to see what information is present in the image file. To view the file, go to the Organizer window. Then use the EXIF Viewer (Display) tab and look at the information it contains. A good way to decide which type of system to use is to consider how you want to share or organize your images. If you'd like to give the images to someone else and they don't use a particular computer, it makes sense to use a metadata-based system. Using a metadata-based system means that the image is stored using generic information that can be shared, sent via e-mail, and is easier to transfer to someone else. For a bit of a closer look at how EXIF works, see the upcoming section "Exposing Your Images," later in

Leicester City winger Riyad Mahrez has been ruled out for a total of eight weeks with the thigh injury he picked up in the draw with Middlesbrough. Mahrez came off after 44 minutes at the Riverside Stadium on Sunday following a challenge from Boro defender Charlie Daniels and is now expected to be sidelined for four to five weeks. The Algeria international was injured in what looked like a toe drag from Daniels and then was brought down by another Boro defender following the game-winning goal by Kelleher. Mahrez has played the first 14 league games for the Foxes this season and set up Riyad Meghni for Leicester's first goal on his debut against Manchester United, making a substitute appearance in the dramatic 4-3 Premier League triumph over the Red Devils two weeks ago. Mahrez, who has four goals in 22 appearances for Leicester this term, was in buoyant mood following his return to the Leicester team in the 1-0 win at Southampton on Saturday. He said: "It's a little bit frustrating. It's my first injury of the season and the first one is always the most important. "It's my first injury for the season. We will have to wait for the doctors because I'm happy the ball didn't go off my thigh. I'm happy for the season. It's a shame, it's the worst one. "I am happy. We qualified and that's the main thing. It's a pity because I played well. The results are what they are. I will come back stronger to help the team as much as I can." Mahrez ended his four year spell at Leicester City at the end of last season. The 26 year-old then moved to the Chinese Super League on transfer deadline day in August, signing for Guangzhou Evergrande until 2018. The winger has scored twice in nine appearances in the Chinese Super League to earn a return to the Premier League and a move to appear for the Foxes again. "I'm happy about what happened at the end of last season," he said. "I won the league, the FA Cup and the League Cup. I played 31 matches and scored 11 goals. At the same time, I won the DFL-Supercup and reached the Champions League final.

Q: Is there something like a repeat of a linux command within a bash script? I have a shell script like this. SPATH = export PATH="\$SPATH":\$PWD/bin/tensorflow/tensorflow/contrib/makefile It tries to set the value of variable SPATH to this file. But unfortunately the shell is executed first. So this file is not treated as shell script. My question is if there is a way to simulate the line PATH="\$SPATH":\$PWD/bin/tensorflow/tensorflow/contrib/makefile within a bash script? A: You can use exec: exec PATH="\$SPATH":\$PWD/bin/tensorflow/tensorflow/contrib/makefile CrowdFunded Entrepreneurs - YouTubers - scott\_s ===== scott\_s Just wanted to post some useful information on a site I was just looking at. I'm not an entrepreneur (my idea is actually kind of risky, but the kind that has a big payoff and great potential), but this is an interesting business model. I would have expected there to be more content on the site, but I'm surprised to see that there really is very little. I couldn't even find information on how to use the website, so that's a start. Rho-kinase inhibition prevents ARA290-induced disturbance of the cytoskeleton in perfused guinea pig heart. Thrombin-induced activation of platelets is a major cause of myocardial damage that leads to acute coronary syndrome. Activation of platelets increases cytoskeleton rearrangement. This study investigated whether the synthetic Rho-kinase inhibitor, ARA290, prevents the thrombin-induced cytoskeleton rearrangement in the isolated guinea pig heart. Heart perfusion was performed in Langendorff mode with a constant flow. Cytoskeleton proteins were visualized by immunofluorescence and morphometry. After thrombin-stimulation the heart perfused with control Krebs-Henseleit solution (Control + Thrombin) showed an increase in the sarcomere length (SL), compared with the baseline control (SM: 2.89 ± 0.08 vs. 2.47 ± 0
